

## **Risk Control Services for the TWCARMF**

The Texas Water Conservation Association Risk Management Fund Risk Control team provides a wide array of services to Fund Members to help reduce frequency and severity of loss through exceptional risk control services including risk management consulting, cyber risk control and training. Risk Control provides Member Profile reports, risk assessments, security assessments, consultations, program development, training and website resources.

Member profiles are reports sent out annually that provide two objectives. One objective is to demonstrate how the member's claims experience compares to other members via a series of benchmarking exhibits. The second objective is to help members reduce claim frequency and severity with loss control recommendations based on the loss experience of the member.

Consultants provide onsite, virtual and telephonic consults and assessments and consultations in the areas of risk management, safety, and security. Members are provided reports with recommendations to mitigate risk but also, consultants will work with the member on how best to complete the recommendations.

The risk control team can assist in the development of programs such as Safety Officer, Safety Committee, Cyber Security and Leadership.

Risk Control provides onsite classroom, virtual and online training in the areas of safety, risk control cyber security and employment liability. Onsite training can be provided for individual members or regionally for multiple members.

The TWCARMF website at [twcarmf.org](http://twcarmf.org) provides a variety of resources that includes information about coverages, services resources and staff contact information.
